

Project Development Report

1. Step-by-Step Project Development

Step 1: Understanding the Requirements

I first read the project document carefully and understood all the requirements. I noted the important points such as using **HTML, CSS, and Bootstrap**, creating **three web pages**, understanding that AI tools could be used if required, and deploying the completed project using **GitHub Pages**.

Step 2: Planning the Project

Since the project topic was my choice, I decided to develop a **Bookstore Website**. Before starting development, I planned the overall design and decided how each of the three web pages should look and what content they would contain.

Step 3: Collecting Resources

I collected all the required resources for the project, including book cover images, background images, videos, and PDF files that would be used throughout the website.

Step 4: Developing the Website

I started by designing the **Home page (index.html)**. I first created the navigation bar and footer, followed by the featured book cards, carousel, and finally the hero section.

After completing the Home page, I used **ChatGPT** to help generate code and ideas for specific sections of the **About Us** and **Contact Us** pages, such as the hero section and layout components. I then integrated these into my website and customized them by modifying the hero section, changing the navbar and hero section colors to match the website theme, and adding appropriate images and videos to achieve the desired design.

Step 5: Testing and Deployment

After completing all three pages, I checked the website for responsiveness and functionality, deployed it using **GitHub Pages**, and finally prepared this report.

2. Use of AI Tools

During the project, I used **ChatGPT** as a learning and development assistant. It helped me with ideas, implementation approaches, and generating code for specific sections of the website, such as parts of the **About Us** and **Contact Us** pages, improvements to the hero section, carousel, and implementing the rating feature without JavaScript. I customized, modified, and integrated these suggestions into my project instead of using the generated code directly as complete web pages.

I also referred to the **Bootstrap 5 documentation** to understand Bootstrap components, layouts, responsive utilities, and styling while developing the website.

3. Challenges Faced and Solutions

- One of the main challenges was creating the **featured books carousel** using only **HTML, CSS, and Bootstrap**. Since the website contained seven different book series, arranging all the book cards while maintaining a responsive layout required several modifications before achieving the desired design.
 - Another challenge was implementing the **book rating feature** without using JavaScript. I was initially unsure how to achieve this, so I used ChatGPT to understand different approaches and successfully implemented a suitable solution.
-

4. Learning Journey and Completion Process

This project helped me improve my understanding of **HTML, CSS, and Bootstrap** by applying them in a real-world website. I learned how to design a responsive multi-page website, organize content effectively, integrate multimedia resources such as images, videos, and PDFs, and deploy a website using **GitHub Pages**.

I also learned how to use AI tools responsibly as a development assistant for generating ideas, solving implementation challenges, and improving the overall design while ensuring that the final website matched my own planned layout and requirements.

5. Time Taken

Activity	Time Taken
Reading and understanding the project requirements	30 minutes
Planning the website design	20 minutes
Collecting images, videos, and PDFs	60 minutes
Developing the Home page (index.html)	40 minutes
Developing the About Us page	20 minutes
Developing the Contact Us page	10 minutes
Deploying the project using GitHub Pages and README.md file	20 minutes
Preparing the project report	20 minutes
Total Time	Approximately 3 hours 40 minutes
